Important information for ARAS 360 Software Users

Effective immediately, FARO will no longer include the Interactive Collision and Trajectory Simulation (ICATS) module in Reality and HD software.

Existing ICATS users are welcome to continue to use this feature in their current software version. However, future product updates of Reality and HD will no longer have this feature available.

The names of other modules in HD and Reality are being changed to more accurately describe their functionality. These functions will now be available in the programs with these new names:

Current Name	New Name
SCMI	Collinear Momentum Module
SAMI	Momentum Module
Articulation Module	Articulation Animation Module

FARO will continue to provide support for existing users of Reality and HD, including providing support for the ICATS module.

Thank you for being a FARO Public Safety Software user.
